

# Air-Cooled Auto Engine

This engine is designed for combustion and power generation in an automobile. It appears to be air-cooled, as evidenced by the prominent cooling fins on the cylinder block.

## Overview

### High-Performance Air-Cooled Engine

This air-cooled combustion engine is engineered for reliable power generation in automotive applications. Featuring a robust metallic casing and a design optimized for efficient thermal management, it utilizes prominent cooling fins on the cylinder block to maintain operational stability. This unit is built to meet the rigorous demands of automotive propulsion.

## Technical Specifications

Cooling System	Air-Cooled
Construction Material	Metallic
Primary Application	Automotive, Power Generation, Combustion

## Components

### Included Components

- Cylinder block with cooling fins
- Spark plug
- Wiring harness
- Engine casing
- Protective covers
