

Cylindrical Surface Grinding Machine

This cylindrical grinding machine is a precision machine tool designed for grinding cylindrical surfaces. It features a robust construction for stability and accuracy during operation.

Overview

Precision Cylindrical Grinding

The M13 cylindrical grinding machine is a specialized tool engineered for high-precision grinding of cylindrical surfaces. Built with a robust construction, it ensures exceptional stability and accuracy during heavy-duty operations. This machine integrates a grinding wheel head, a precision worktable, and an intuitive control panel, making it a reliable solution for demanding manufacturing and engineering applications.

Machine Features

Core Components

- Grinding wheel head
- Worktable
- Precision control panel

Primary Applications

Manufacturing, Engineering, Cylindrical Grinding

Performance

Operational Focus

High Stability • Precision Accuracy
