

Injection Molding Machine

This injection molding machine is a high-performance machine designed for precision plastic part production. It features a robust clamping unit, a high-efficiency injection unit, and an advanced control system for precise process management.

Overview

High-Performance Injection Molding

The YJ1000 series is a high-performance injection molding machine engineered for precision plastic part production. It integrates a robust clamping unit with a high-efficiency injection system to ensure accurate material delivery and secure mold closure. Designed for versatility, the machine features a modular architecture and an advanced control interface, making it suitable for demanding applications in automotive, electronics, and consumer goods manufacturing.

Technical Features

Clamping Unit	Robust clamping unit designed for secure and precise mold closure
Injection Unit	High-efficiency unit with optimized screw design for various material types
Control System	Advanced process management with real-time quality control monitoring

Performance & Efficiency

Energy Management	Yes
Hydraulic System Type	Energy-saving hydraulic system

Applications

Suitable Industries	Automotive, Electronics, Consumer Goods
---------------------	---

Design

Customization	Modular design allows for configuration to specific production requirements
