

Networked System Management Software

This software manages operations across multiple stations connected to a central server. It enables centralized management for transaction processing, reporting, and data synchronization.

System Overview

Centralized Networked Management

This advanced networked management software provides a unified platform for overseeing operations across multiple distributed stations. By connecting local terminals to a central server via the internet, the system ensures seamless synchronization of transaction data and reporting. It is designed to scale from local station management to head office oversight, supporting high-efficiency operations.

System Architecture

Supported Station Peripherals

- Ticket Printers
- Cash Boxes
- Report Printers
- Message Transmitters
- Station PCs
- Customer Displays
- Card Publishers
- Oil Tank Monitoring Systems

Core Functional Features

Feature Category	Capability
Transaction Processing	Real-time data logging
Reporting	Cross-station analytics
Synchronization	Data consistency between stations and head office
Hardware Control	Integrated printer and card publisher management

Connectivity Type

Internet-based, Client-Server, Centralized, Multi-Station
