

Two-Way Network Signal Splitter

This two-way splitter is designed for splitting a single input signal into two output signals. It is suitable for various applications in communication networks.

Product Overview

Professional Network Signal Splitting

This two-way network signal splitter is engineered for efficient signal distribution in communication networks. It reliably splits a single input signal into two distinct output signals, facilitating flexible network architecture. Designed with a durable housing and industry-standard connectors, this device ensures seamless integration and long-term performance for professional communication setups.

Technical Specifications

Construction

Durable Housing • Standard Connectors

Splitter Type	Two-Way
Primary Application	Network Communication, Signal Distribution
Installation	Easy installation with standard connectors
