

Air Caster Load Moving System

This air caster system is designed for moving heavy machinery and equipment. It utilizes pressurized air to create a thin layer, allowing for easy and controlled movement of heavy loads.

Overview

Air Caster Load Moving System

The Air Caster Load Moving System utilizes advanced pneumatic technology to transport heavy machinery and equipment with minimal effort. By creating a thin, pressurized layer of air between the load and the floor, the system allows for omnidirectional movement of objects with varying shapes and sizes. This solution is designed for industrial and manufacturing environments, offering a clean, safe, and efficient alternative to traditional mechanical transport methods.

Operational Benefits

Environmental & Safety Features	No sparks, No exhaust, No noise, Eco-friendly energy
Operational Efficiency	Yes

System Configuration

Included Components

- Air caster modules
- Control unit
- High-pressure hoses

Movement Versatility	Omnidirectional movement for machines of varying shapes
