

Air to Water Heat Pump System for Domestic Use

This air-to-water heat pump system is designed for domestic hot water and heating applications. The system offers energy-efficient performance and a compact footprint suitable for residential installations, comprising an outdoor unit and an indoor water storage tank.

Overview

Energy-Efficient Domestic Heating

This air-to-water heat pump system is a comprehensive solution designed specifically for domestic hot water and residential heating applications. The system features a dual-unit configuration with an outdoor unit and an indoor water storage tank, optimized for energy-efficient performance. Its compact footprint makes it an ideal choice for residential installations where space and efficiency are primary considerations.

System Configuration

Included Components

- Outdoor heat pump unit
- Indoor water storage tank

System Type	Air-to-Water Heat Pump
-------------	------------------------

Applications

Primary Applications	Domestic Hot Water, Residential Heating
----------------------	---

Design & Installation

Design Features

Compact Footprint • Energy Efficient • Residential Grade
