

Airport Terminal Building

This is a large airport terminal building. The design incorporates a cylindrical tower and rectangular buildings.

Overview

Modern Airport Terminal Infrastructure

The Beijing Capital International Airport Terminal 3 represents a state-of-the-art approach to large-scale aviation infrastructure. Designed with a focus on contemporary aesthetics and functional efficiency, this terminal building integrates complex architectural elements to manage high-volume passenger traffic. Its segmented exterior and expansive layout provide a scalable solution for modern international air transport hubs.

Facility Type	Airport Terminal Building
Design Style	Modern, Contemporary, Functional, Large-Scale

Infrastructure Details

Key Architectural Features

- Cylindrical control tower structure
- Segmented exterior facade
- Integrated rectangular terminal blocks
- High-capacity modular design
