

Audio Transducer for Electronic Devices

This audio transducer is designed for converting electrical signals into audible sound waves. Its robust construction ensures durability and reliable operation in diverse environments.

Overview

High-Performance Audio Transducer

This audio transducer is engineered for precision sound conversion in a wide range of electronic devices. With its robust construction, the component ensures reliable performance in both audio-video equipment and critical signaling systems. It is an ideal solution for engineers seeking clarity and durability in compact electronic integration.

Technical Specifications

Primary Applications

- Audio-video products
- Alarm systems
- Communication devices

Available Models

KD-7, GHL, KD-10
