

Automated Transit System

This automated transit system provides efficient and reliable transportation. It utilizes advanced technology to optimize railway operations.

System Overview

Automated Transit Solution

The Automated Transit System represents a state-of-the-art solution for modern urban rail networks. Designed for safety and efficiency, it features advanced train control technology that minimizes human intervention while maximizing passenger throughput. The sleek design, combined with robust infrastructure support, provides a reliable and seamless transportation experience for high-traffic environments.

System Type

Automated • Urban Rail • Subway

Operational Safety

Safety Infrastructure

- Tactile platform paving for visually impaired
- Automated stopping precision
- Modern signaling and control systems

Stop Marker Compliance

Standardized platform stop markers (f)
