

Blind Rivets

Blind rivets join materials together using a rivet body and setting mandrel. A special tool pulls the mandrel, expanding the rivet body to secure materials before the mandrel snaps off.

Product Overview

Versatile Fastening Solutions

Blind rivets, often referred to as pop rivets, are essential fasteners designed for joining materials where access is restricted to only one side. The assembly consists of a rivet body and a setting mandrel, which expands the body upon installation to create a secure, permanent joint. These fasteners are widely utilized across demanding sectors including automotive, aerospace, and general construction for their reliability and ease of use.

Technical Details

Fastener Type	Blind Rivet (Pop Rivet)
Installation	Mandrel pull-through with specialized setting tool

Applications

Access Requirements	Single-sided access
Primary Industries	Automotive, Aerospace, Construction
