

# Brake Master Cylinder

This brake master cylinder is a hydraulic device converting brake pedal force into hydraulic pressure. The pressure is transmitted through brake lines to activate the brakes.

## Product Overview

### High-Performance Brake Master Cylinder

This hydraulic brake master cylinder is engineered to convert mechanical force from the brake pedal into precise hydraulic pressure. Designed for reliability and consistent performance, it features an integrated reservoir system and durable seals to ensure optimal fluid management. It serves as the critical link in your braking system, transmitting pressure through lines to calipers or wheel cylinders to ensure safe and responsive stopping power.

## Technical Specifications

### Key Components

- Integrated fluid reservoir
- Internal piston mechanism
- Hydraulic ports
- High-pressure seals

<b>Core Function</b>	Hydraulic pressure conversion
<b>Application</b>	Automotive Braking, Hydraulic Systems
