

CNC Polygon Milling and Turning Machining Center

CNC polygon milling and turning machining center can perform turning, polygon milling, slotting, and laser operations in a single clamping. This improves processing accuracy and efficiency, reducing costs.

ADDITIONAL IMAGES

Overview

Precision Machining Center

This CNC Polygon Milling and Turning Machining Center is engineered for complex metal cutting operations, integrating advanced milling and turning capabilities into a single unit. Designed to handle intricate parts with tight tolerances, the machine allows for turning, polygon milling, slotting, and laser processing in a single clamping operation. This streamlined process significantly improves machining efficiency and accuracy while reducing overall production costs for your enterprise.

Capabilities

Key Advantages

- Single-clamping process
- Improved processing accuracy
- Increased production efficiency
- Reduced operational costs

Supported Operations

Turning, Polygon Milling, Slotting, Laser Processing

Customization

Customization

Yes

Service Details

Personalized design and multifunctional machine customization available based on specific customer requirements.

Technical Features

Key Features

Multi-axis control • Robust spindle • Versatile tool changer • Coolant system
