

Coal-Fired Power Plant Project

This is a coal-fired power plant project. It demonstrates power generation infrastructure and engineering on a large scale.

Project Overview

Barapukuria Power Generation Facility

This large-scale coal-fired power plant project represents a significant achievement in international power engineering and infrastructure development. The facility integrates complex systems including cooling towers, advanced smokestacks, and comprehensive power generation infrastructure to ensure reliable energy output. Designed for high-capacity operation, the project exemplifies modern standards in the construction and management of large-scale thermal power generation facilities.

Project Type

Coal-Fired Power Plant

Technical Infrastructure

Core Infrastructure Components

- Cooling towers
- Industrial smokestacks
- Power generation buildings
- Water-side facility integration

Engineering Focus

Power Generation, Thermal Energy, Infrastructure Contracting, Large-Scale Construction
