

Construction Elevator Framework

Framework designed to support construction elevators during the building process. It provides the infrastructure required for vertical transportation of materials and personnel.

Product Overview

Robust Vertical Transportation Framework

This construction elevator framework provides the essential structural foundation for vertical transportation systems on active construction sites. Engineered for stability and reliability, the system incorporates heavy-duty steel bracing and concrete support integration to ensure safety during high-rise building projects. Designed to support the infrastructure of elevator cars, this framework is a critical component for efficient material and personnel movement.

Technical Specifications

Structural Components

- Reinforced steel bracing
- Concrete support interface
- Vertical rail infrastructure
- Load-bearing framework

Construction Stage

Preliminary Infrastructure • Pre-Installation

Application

Construction Site, Vertical Transportation, High-Rise Infrastructure
