

Cuplock Scaffolding Standard

This cuplock standard is a vertical support component in scaffolding systems. It allows for quick assembly and enhanced safety on construction sites due to its robust design and secure locking mechanism for horizontal ledgers.

Product Overview

Cuplock Scaffolding Standard

The Cuplock Standard serves as a fundamental vertical support component within scaffolding systems. Engineered for high load-bearing capacity, it utilizes a robust locking mechanism that allows for the secure and efficient connection of horizontal ledgers. This system is designed to enhance construction site safety and assembly speed, utilizing high-strength steel to ensure long-term durability and stability.

Technical Specifications

Material	High-strength steel
Function	Vertical support and load-bearing
Assembly Features	Quick assembly, Easy connection, Versatile configuration
