

Cuplock Scaffolding Standard

The Cuplock Standard is a key component in scaffolding systems, providing vertical support and load-bearing capacity. This robust standard features a series of cups at fixed intervals, allowing for the quick and secure connection of horizontal ledgers and other components.

Product Overview

Cuplock Scaffolding Standard

The Cuplock Standard serves as a fundamental vertical support component in professional scaffolding systems, engineered to provide exceptional load-bearing capacity. Designed with a modular system of cups at fixed intervals, it facilitates the rapid and secure connection of ledgers and transoms. This high-strength steel construction ensures maximum stability and safety for diverse construction and maintenance applications.

Technical Specifications

Scaffolding System

Cuplock

Key Features

- Modular design for flexible configuration
- Fixed cup intervals for secure connections
- High load-bearing capacity
- Rapid assembly and dismantling

Material

High-strength steel
