

Cylinder Head with Cooling Fins

This cylinder head is constructed with cooling fins, likely aluminum, to dissipate heat. It appears to be a component of an internal combustion engine, featuring circular openings for spark plugs.

Product Overview

High-Performance Cylinder Head

This cylinder head is engineered for optimal thermal management in internal combustion engines. Featuring a robust design with integrated cooling fins, it efficiently dissipates heat to maintain engine stability during operation. This component is essential for maintaining performance and longevity in demanding mechanical environments.

Design & Construction

Cooling System

Air-cooled • Fin-based dissipation

Key Features

- Parallel cooling fins
- Dual circular ports
- Optimized heat dissipation geometry

Material	Aluminum
----------	----------

Application

Primary Application	Internal combustion engine component
---------------------	--------------------------------------
