

Diesel Generator Engine Block

This engine block is made of cast iron and features multiple cylinder bores. It is a crucial part of the diesel generator assembly.

Product Overview

Heavy-Duty Diesel Engine Block

This industrial-grade engine block serves as the critical foundation for diesel generator assemblies. Engineered from high-durability cast iron, it is designed to house essential internal components including pistons and the crankshaft. Its robust architecture provides the necessary structural integrity to contain the high-pressure combustion process, ensuring long-term reliability and performance in demanding power generation applications.

Technical Specifications

Primary Application

Diesel Generator • Power Generation • Industrial Engine

Design Features

- Multi-cylinder bore configuration
- High-pressure combustion containment
- Structural housing for crankshaft and pistons

Material

Cast Iron
