

Dual Brake Master Cylinder

This brake master cylinder is a critical component in a vehicle's braking system. It converts mechanical force from the brake pedal into hydraulic pressure, which is then transmitted to the wheel cylinders or calipers to apply the brakes.

Overview

Dual Brake Master Cylinder

This dual brake master cylinder is a critical safety component designed to convert mechanical force from the brake pedal into hydraulic pressure. Featuring a dual-reservoir design, it provides essential redundancy for the braking system, ensuring that one circuit remains operational even if the other fails. Constructed from durable metal materials, this unit is engineered for reliability and consistent performance in automotive braking applications.

Technical Details

Safety Features

Dual Reservoir • Redundant Circuitry

Design Type	Dual Circuit
Construction Material	Aluminum, Cast Iron
Mounting Configuration	Flange Mount

Components

Included Components

- Reservoir Caps
- Brake Line Fittings
- Mounting Flanges
