

Engine Bearing Set

Engine bearing sets are made from copper alloy. These bearings provide a low-friction surface between connecting rods and the engine block for efficient operation.

Product Overview

Precision Engine Bearing Set

This engine bearing set is precision-engineered to provide a critical low-friction interface between the crankshaft and connecting rods. Designed to meet rigorous maintenance requirements, these components ensure smooth, efficient engine operation and optimal heat dissipation. Each bearing is crafted for a precise fit, contributing to extended engine life and reliable performance under demanding conditions.

Technical Specifications

Material	Copper alloy
Compatible Engine Model	4JB1
Size Standard	STD (Standard)

Quality & Standards

Key Performance Indicators

1 High Friction Reduction	1 Optimized Heat Dissipation
-------------------------------------	--

Certifications	OEM Specification Compliant, Professional Quality System Certified
