

Engraving Machine

This machine is designed for engraving and etching various materials. It utilizes precision technology to create detailed designs and markings.

Product Overview

Precision Component Sealing

This assortment of oil seals is engineered for both rotary and reciprocating motion applications, providing essential protection against lubricant leakage and external contaminants. Featuring a flexible elastomer lip design, these seals ensure a tight, reliable interface against rotating shafts to maintain optimal mechanical performance. The robust outer case design facilitates a secure fit within housing bores, making these components vital for extending the operational lifespan of industrial machinery.

Technical Specifications

Seal Construction

- Flexible lip design
- Elastomer sealing element
- Reinforced outer case

Primary Functions

Leak Prevention • Contaminant Protection • Equipment Longevity

Application Types

Rotary Motion, Reciprocating Motion
