

Foot Valve with Strainer

This foot valve acts as a check valve on the suction side of a pump to maintain its prime. It allows flow in one direction and includes a screen to prevent debris from entering the pump.

Product Overview

Essential Pump Protection

This foot valve with integrated strainer is designed for installation on the suction side of pump systems. It functions as a specialized check valve that allows flow in one direction only, effectively retaining pump prime and preventing backflow when the pump is idle. The built-in strainer serves as a critical barrier, preventing debris from entering the pump mechanism and protecting against potential damage from dry running.

Technical Specifications

Application Notes

- Installed on the suction side of pumps
- Prevents dry running damage
- Maintains pump efficiency

Valve Type	Foot Valve with Strainer
Key Functions	Check Valve, Pump Priming, Backflow Prevention, Debris Filtration
