

Heat Pump Water Heater System

This water heater system consists of an outdoor heat pump unit connected to a water tank. The heat pump extracts heat from the air to warm water stored in the tank, providing a hot water supply for residential or commercial use.

Product Overview

High-Efficiency Heating Solution

This heat pump water heater system is an advanced thermal solution designed for residential and commercial applications. By extracting ambient heat from the surrounding air, the unit provides a sustainable and highly energy-efficient method for consistent hot water production. The integrated design features a dedicated outdoor heat pump unit paired with a robust storage tank, ensuring reliable performance and reduced operational costs.

System Configuration

System Components

- Outdoor heat pump unit
- Thermal water storage tank
