

Home Heating and Hot Water System

This system provides both domestic hot water and space heating. It includes a wall-mounted water heater connected to a radiator, kitchen sink, and bathtub.

Product Overview

Integrated Home Climate and Water Solution

This advanced heating and hot water system is designed to provide comprehensive climate control and sanitary water supply for modern residential environments. By integrating space heating through radiators with a domestic hot water circuit, the unit ensures consistent temperature management and reliable water delivery to kitchen and bathroom fixtures. The system features a streamlined wall-mounted design that maximizes space efficiency while maintaining high operational performance for both domestic and heating needs.

Technical Features

Core Functionality

- Space heating via radiators
- Domestic hot water supply
- Integrated heating and return water flow
- Cold water supply management

Configuration

Wall-mounted • Combined Heating and Hot Water

System Connections

System Flow Points

Connection Type	Application
Heating Supply	Space Heating
Heating Return	Space Heating
Domestic Hot Water	Sanitary Usage
Cold Water Inlet	Supply Line
