

# Hydropower Generation Station

This hydropower station uses a large dam to retain water for electricity generation. The dam features spillways and control structures for regulating water flow.

## Overview

### Hydropower Generation Station

This large-scale hydropower generation facility utilizes a concrete gravity dam structure to harness the kinetic energy of water for reliable electricity production. Designed for significant energy output, the station features integrated spillways and advanced control mechanisms to effectively manage water flow and reservoir levels. It serves as a critical infrastructure solution for sustainable power generation and efficient water resource management.

## Technical Specifications

### Key Infrastructure Features

- Integrated spillways
- Advanced control structures
- Gravity-based retaining wall

<b>Dam Type</b>	Concrete Gravity Dam
<b>Primary Functions</b>	Electricity Generation, Water Resource Management, Flow Regulation
