

Large Flange Blind Rivets

Blind rivets with a large flange are designed for applications requiring a wider bearing surface. These rivets provide increased pull-through resistance and are suitable for fastening soft or brittle materials.

Product Overview

Large Flange Blind Rivets

Large flange blind rivets are specialized fasteners engineered for applications that demand a wider bearing surface. By distributing the load over a greater area, these rivets offer superior pull-through resistance, making them an ideal choice for fastening soft or brittle materials without causing damage. These reliable components are essential for securing joints in automotive, construction, and appliance manufacturing environments.

Key Features

Primary Benefits

- Increased pull-through resistance
- Wider bearing surface for load distribution
- Prevents damage to soft or brittle materials
- Versatile for multiple industries

Common Industries

Automotive, Construction, Appliance
