

Large-Scale Power Generation Facility

This is a large-scale power generation facility. It includes power generation units, cooling towers and emission control systems.

Overview

Industrial Power Generation Facility

This large-scale power generation facility is engineered for high-capacity electricity production, utilizing advanced thermal power technology. The installation integrates essential infrastructure including generation units, cooling systems, and emission control stacks to ensure efficient and compliant operations. Designed for grid-scale energy distribution, the facility features comprehensive turbine, generator, and control systems alongside necessary substation and transmission infrastructure.

Facility Infrastructure

Core Infrastructure

- Power generation units
- Cooling towers
- Turbine and generator housing
- Control systems
- Emission control systems
- Substations
- Transmission lines

Environmental Compliance

Emission Control Systems • Pollution Reduction

Technical Specifications

Facility Type	Thermal Power Plant
Likely Fuel Source	Coal, Natural Gas
