

Mobile Communication System Enclosure

This metallic enclosure houses electronic components for mobile communication systems. Applications include signal amplification, filtering, or frequency conversion within mobile phone networks or testing equipment.

Product Overview

Professional Communication Enclosure

This high-performance metallic enclosure is engineered for mobile communication systems, providing robust protection for sensitive electronic components. Designed for versatility, it is suitable for applications such as signal amplification, frequency conversion, and network testing equipment. Its durable construction ensures reliable performance in demanding technical environments.

Physical Characteristics

Form Factor	Rectangular
Material	Metallic

Connectivity

Connector Interface	Coaxial
---------------------	---------

Application

Primary Applications

- Signal Amplification
- Signal Filtering
- Frequency Conversion
- Mobile Network Testing
