

Mobile Phone Communication Filter Component

This is a metallic component used in mobile phone communication systems. It features a silver finish and cylindrical protrusions, likely connectors for high-frequency signal processing.

Product Overview

High-Frequency Communication Component

This metallic filter component is engineered for precision signal processing in mobile communication systems. With its robust, rectangular construction and integrated cylindrical connectors, it is designed to facilitate reliable high-frequency signal transmission. It is an essential part for maintaining signal integrity within mobile devices or base station infrastructure.

Physical Specifications

Form Factor	Rectangular metallic housing
Surface Finish	Silver
Connector Configuration	Dual cylindrical protrusions

Application

Primary Application	Mobile Communication, Signal Processing, Base Station Infrastructure
