

Modified Truss Head Self-Drilling Screw

This is a self-drilling screw with a modified truss head. The design ensures efficient drilling and fastening, providing a wider bearing surface for increased holding power and a flush finish.

Product Overview

Modified Truss Head Self-Drilling Screw

This self-drilling screw is engineered for efficient fastening in various materials, featuring a specialized modified truss head. The unique head design provides a wider bearing surface than standard screws, ensuring increased holding power and a clean, flush finish. By incorporating a self-drilling tip, this fastener eliminates the need for pre-drilled holes, significantly streamlining the installation process for professional applications.

Technical Specifications

Head Type	Modified Truss Head
Fastening Method	Self-Drilling

Features

Key Benefits

- Wider bearing surface for increased holding power
- Self-drilling tip eliminates pre-drilling
- Flush finish for minimal surface protrusion
- Efficient installation
