

Mounted Rotary Hay Rake

These mounted rotary rakes are agricultural machines designed for efficient hay and forage collection. The rotary mechanism gently gathers cut crops into windrows for easy baling or harvesting.

Overview

Efficient Hay Collection

The mounted rotary hay rake is a specialized agricultural machine designed to streamline the collection of mown grass and forage. Featuring a robust frame for stable tractor mounting, this rake utilizes a rotary mechanism with multiple tines to gently gather crops into uniform windrows. Its adjustable settings allow for precise control over windrow width and raking intensity, making it an essential tool for maximizing productivity and minimizing crop loss during harvest.

Performance

Primary Function	Hay and forage collection
Key Features	Tractor-mounted, Adjustable windrow width, Adjustable raking intensity, Robust construction

Design

Mounting Type	Mounted
Mechanism	Rotary with tines
