

Multi-Tiered Software Architecture

This software architecture employs a multi-tiered structure based on the J2EE framework. It incorporates presentation, business, and data layers.

Product Overview

J2EE Multi-Tiered Framework

This multi-tiered software architecture leverages the robust J2EE framework to provide a scalable, secure, and modular environment for enterprise applications. The design effectively separates concerns across three distinct layers—presentation, business, and data—ensuring high performance and easy integration. It is fully compatible with industry-standard application servers, allowing for flexible deployment and robust management of complex business workflows.

Technical Architecture

Core Architecture Layers

- Presentation Layer
- Business Layer
- Data and Business System Layer

Supported Application Servers

Weblogic, WebSphere, JBoss

Business Layer Components

Core Business Components

| Category | Capabilities |
|---------------|--|
| Processing | Workflow engine, Rule engine |
| Data Handling | Full-text search, JCA, JMS |
| Integration | Web services, Message management, Connectors |

Integration & Compatibility

Connectivity & Interoperability

HTTP • RMI-IIOP • J2EE • Web Services • Microsoft .NET
