

Network Communication Device for Data Transmission

This network communication device is designed for reliable data transmission and network management. It features a front panel display for monitoring status, various function controls, and secure access mechanisms.

Overview

Professional Network Communication Solution

The GFD1550-A is a high-performance network communication device engineered for reliable data transmission and robust network management. Designed for professional networking environments, this unit features an intuitive front panel display for real-time status monitoring. It includes secure access mechanisms and essential functional controls to ensure consistent performance and operational efficiency.

Technical Specifications

Model Number	GFD1550-A
Interface Controls	Function, Reset, Output, Power

Features

Device Capabilities

- Real-time status monitoring
- Secure access mechanisms
- Reliable data transmission
- Professional network management
