

Petroleum Products Distillation Tester

This distillation tester determines the distillate of engine fuel, solvent oil, and light petroleum products. It is designed for precise control and monitoring of the distillation process, ensuring accurate results for quality control and research.

Product Overview

Precision Distillation Testing

The Petroleum Products Distillation Tester is a specialized laboratory instrument engineered for determining the distillation characteristics of engine fuels, solvent oils, and light petroleum products. It provides precise control and monitoring of the distillation process, ensuring reliable data for quality control and research applications. By accurately measuring the boiling range distribution, this apparatus serves as a critical tool for characterizing the performance and properties of various petroleum-based substances.

Technical Specifications

Application Scope

- Engine fuels
- Solvent oils
- Light petroleum products

Primary Measurement

1 parameter

Boiling Range Distribution

Core Functions

Heating system, Temperature measurement, Distillate collection, Process monitoring
