

Plastic Film Extrusion Line

This extrusion line is designed for manufacturing plastic films with precise control over thickness and width. The system automates material feeding, extrusion, cooling, and winding processes.

Overview

High-Performance Film Production

This plastic film extrusion line is engineered for high-precision manufacturing, incorporating advanced stages for material feeding, extrusion, cooling, and winding. The system features a robust support structure equipped with sophisticated tension controls and rollers to ensure consistent film quality. Designed for automated operation, the centralized control panel allows for precise management of film thickness and width, making it a reliable solution for industrial film production.

Technical Specifications

Processing Stages

- Material Feeding
- Extrusion
- Cooling
- Winding

Control System

Centralized automated control panel

Key Features

Automated Operation, Precision Thickness Control, Tension Control, Robust Construction
