

Precision Metal Bearing

Precision-engineered metal components designed for mechanical applications. These components feature smooth surfaces and are suitable for precision instruments or machinery.

Product Overview

Precision Engineering for Industrial Applications

These precision-engineered metal rods and cylindrical components are designed to meet the rigorous demands of various mechanical systems. Crafted from high-grade, durable alloys such as stainless steel, these components offer exceptional resistance to wear and smooth surface finishes. They are ideal for use in precision instruments, bearing assemblies, automated machinery, and high-performance shafts.

Technical Specifications

Component Category

Precision Shaft • Mechanical Bearing Component

Material Type

Stainless Steel, High-Grade Alloy

Surface Quality

Precision-machined smooth finish

Application Data

Primary Applications

- Bearing assemblies
- Precision shafts
- Automated system components
- Precision instrumentation
