

Radio and TV Broadcasting System

This device supports multiple mainstream data broadcasts and integrates various Conditional Access (CA) systems. It offers a high-performance and cost-effective solution for radio and television broadcasting applications, improving upon the traditional card separation model.

Overview

Professional Broadcasting Integration

This advanced Radio and TV Broadcasting System is designed to replace traditional hardware-dependent models with a streamlined, software-integrated solution. By supporting multiple mainstream Conditional Access (CA) systems and data broadcast formats, it offers unparalleled versatility for modern broadcasting infrastructure. The system is engineered for high performance, providing a cost-effective alternative to traditional 'card separation' setups while maintaining compatibility with diverse interface standards.

Technical Capabilities

System Architecture

- Integrated mainstream data broadcasting
- Multi-interface support
- Advanced software-defined CA integration
- Next-generation alternative to card separation models

Conditional Access Support

Multi-CA Integration, Data Broadcast Support
