

Rooftop Solar and Wind Hybrid Power Generation System

This system integrates solar and wind energy conversion. It is designed for renewable energy production using photovoltaic panels and wind turbines.

Overview

Sustainable Hybrid Power Generation

This rooftop solar and wind hybrid power generation system provides a comprehensive distributed energy solution for sustainable power production. By integrating high-efficiency photovoltaic panels with small-scale wind turbines, the system optimizes electricity generation across varying environmental conditions. It is engineered to maximize renewable energy capture, offering a robust and reliable source of clean power for professional installations.

Technical Specifications

Integrated Components

- Photovoltaic solar panels
- Small wind turbine assembly
- Integrated power management hardware

System Category	Renewable Energy, Hybrid Power, Distributed Generation
-----------------	--------------------------------------------------------

Application

Primary Mounting	Rooftop
------------------	---------
