

Single Cylinder Gasoline Engine

This compact gasoline engine is commonly used in small power equipment such as lawnmowers and generators. It features an overhead valve (OHV) configuration and a recoil starter.

Overview

Compact Power Solution

This single-cylinder, four-stroke gasoline engine is engineered for versatility and reliability in small power equipment applications. Featuring an overhead valve (OHV) configuration, it delivers optimized fuel efficiency and consistent power output for machinery such as generators, tillers, and lawn equipment. Its compact, lightweight design ensures easy integration and portability for various professional and commercial tasks.
