

Stator Segment with Windings

This is a curved stator segment with salient poles and windings. It is likely part of a larger electric motor assembly.

Product Overview

Stator Segment with Windings

This stator segment is engineered for high-performance electric motor assemblies, featuring a curved design with salient poles. It incorporates precision-wound copper windings to support high-torque applications. The assembly is reinforced with a durable white plastic housing, providing both necessary electrical insulation and structural integrity for demanding industrial environments.

Technical Construction

Design Type	Curved stator segment
Key Features	Salient poles, Laminated core, Copper windings, Insulated housing
Housing Material	White plastic
