

Substation Automation System Software

This software manages and monitors electrical equipment within a substation environment. It facilitates automated control and data acquisition for efficient operation.

System Overview

Substation Automation System Software

This advanced substation automation software provides a comprehensive framework for the integrated control, monitoring, and management of high-voltage electrical environments. Designed to enhance operational efficiency and maintenance, the system facilitates seamless data acquisition and real-time control across 110KV and 35KV power infrastructure. The architecture supports robust network integration between workstations, servers, and protective control panels.

Supported Voltage Levels	110KV, 35KV
--------------------------	-------------

Technical Architecture

Key Components

- Workstations
- Management Servers
- Communication Infrastructure
- Protective Control Panels
- Line Protection and Monitoring Devices

Compatible Product Series

DMP-9000 Series

Network Integration	Yes
