

Textile Machinery Component with Electrical Power

This is a textile machinery component used in apparel or textile manufacturing processes. It has a ribbed top surface and ventilation holes and requires electrical power.

Product Overview

Industrial Textile Machinery Component

This specialized textile machinery component is engineered for reliability in demanding apparel and manufacturing environments. Designed with an integrated power supply, the unit features a ribbed top surface for thermal management and optimized ventilation ports along the chassis to ensure stable performance. The included power cable system allows for quick integration into existing production lines.

Technical Specifications

Primary Application

Textile Manufacturing • Apparel Production

Model Identification

SKT-103

Power Requirements

Yes

Design Features

Surface Configuration

Ribbed Top, Ventilated Chassis
