

Textile Machinery Monitoring System

This system enables real-time monitoring of textile machinery. It facilitates data logging for performance analysis and maintenance planning.

System Overview

Industrial Monitoring Solution

This advanced monitoring system is specifically designed for the textile industry, providing robust data logging and surveillance capabilities. The unit integrates seamlessly with industrial power outlets to ensure continuous operation and reliable data acquisition. By combining power connectivity with visual recording hardware, this solution empowers facility managers to track machinery performance and maintain operational oversight in demanding environments.

Technical Specifications

Key Components

- Power adapter/charger unit
- Integrated optical recording/surveillance device

Connectivity

Wired, Direct Outlet

Operational Metrics

Primary Function

Data Logging • Surveillance • Process Monitoring
