

Textile Machinery Water Filtration System

This component is designed for use in apparel and textile machinery. It is a water filtration system, likely for maintaining water quality in textile processing applications.

Product Overview

Advanced Textile Water Filtration

This water filtration system is specifically engineered for apparel and textile machinery environments. It ensures optimal water quality for processing applications by utilizing a high-efficiency filtration unit paired with an integrated electronic monitoring device. This dual-component design allows operators to seamlessly track filter usage and maintain consistent water purity standards, enhancing the longevity of textile machinery.

Technical Details

Model Number	BJM-1(BSA4)
Primary Application	Apparel Machinery, Textile Processing, Water Quality Management

System Components

Included Components

- Pitcher-style filtration unit
- Electronic monitoring device

Monitoring Functions

Filter Usage Tracking • Water Quality Parameters
