

Universal Joint Fitting for Torque Transmission

This universal joint fitting transmits torque and rotational motion between shafts that are not aligned. The fitting is constructed from durable metal and features precision-engineered joints for efficient power transfer.

Product Overview

Universal Joint Fitting

This universal joint fitting is precision-engineered to facilitate the transmission of torque and rotational motion between shafts that are not aligned on the same axis. Constructed from durable metal, the unit features a compact design that ensures smooth and efficient power transfer. It is an ideal solution for various industrial applications where angular misalignment must be accommodated.

Technical Specifications

Design Features

- Compact design
- Precision-engineered joints
- Accommodates angular misalignment

Application

Torque and rotational motion transmission

Material

Durable Metal

Performance Metrics

Key Performance Indicators

1 High

Efficiency
