

V-Type Ball Valve

This ball valve is designed in a V-type configuration. It is used for regulating and cutting off media at a pressure of 1.6MPa.

Product Overview

V-Type Ball Valve Overview

The V-Type Ball Valve is a precision-engineered component designed for reliable flow regulation and shut-off applications. Engineered to withstand pressures up to 1.6MPa, this valve provides consistent performance across a wide range of nominal diameters from DN15 to DN150. Its robust construction makes it an ideal solution for industrial fluid control systems requiring accurate regulation.
