

Vertical Rubber Injection Molding Machine

This vertical rubber injection molding machine is engineered for efficient and precise production of rubber components. It features a hydraulic system, a programmable logic controller (PLC) for automated operation, and a user-friendly interface.

Product Overview

Precision Vertical Injection Molding

This vertical rubber injection molding machine is engineered for high-efficiency production of rubber components such as seals, gaskets, and bespoke molded parts. Its vertical configuration significantly optimizes workshop floor space and simplifies the mold change process for increased operational agility. Equipped with a high-performance hydraulic system and an automated PLC-controlled interface, the unit ensures consistent product quality and ease of use for operators.

Operational Specifications

Suitable Applications

- Rubber Seals
- Gaskets
- Custom Molded Parts

Automation Control

Programmable Logic Controller (PLC) with user-friendly interface

Clamping Orientation

Vertical
